CS 102 - Lab 00

ÖZYEĞİN
ÜNİVERSİTESİ

1. Create two separate classes Employee and EmployeeTest

2. Implement a public class **Employee** for the first class. An Employee has the following information: name, age, designation, and salary.

3. Implement a separate constructor for each information that is name, age, designation, and salary

4. Implement a method named printEmployee() to display the employee details

5. For the second class Implement a public class **EmployeeTest**

6. Implement a EmployeeTest class with a main method that creates two employee objects For example "Mehmet" and "Aydan". Then, call their printEmployee() method to print their information.

Good luck,
